

1: PointToMouse2D : MonoBehaviour for Spaceship Sprite. Chosen to allow the Spaceship to track the player's mouse movements. No other inputs were considered.

2: Input.GetKeyDown(KeyCode.Space) for spaceship sprite. Chosen to enable the script to "spawn" a laser shot in the direction of where the ship sprite is pointing. Other keybinding scripts were considered, but spacebar was chosen for "big button satisfaction".

3: OnSpacePressed() for warped shooting fx sprite. Chosen to receive the space the space bar input to trigger the laser shot script. No other inputs were considered.

4: Input.GetKeyDown(KeyCode.S) to start game and timer scripts. Chosen to enable game start/restart after defeat, as well as to start timer script. Other Keybinds considered, but S for Start made the most sense.

5: OnSPressed() for receiving the Previous triggers, in both the timer and the game. Chosen to because it will trigger from Input.GetKeyDown(KeyCode.S). No other inputs considered.

6: GameObject objectToSpawn to spawn asteroids. Additional code to have them spawn at set times and have them move towards the player's sprite. Was chosen as this is the necessary code to create an object in Unity. No other options considered.

7: OnCollisionEnter(Collision collision) for asteroids to hit the player and for the laser to hit asteroids. Was chosen as it is vital to enable game objects to interact. No other options considered.

8: (Input.GetKeyDown(KeyCode.Escape) to enable a paused game state and allow the player to quit if needed. Was chosen as it made the most sense for both pausing the game and quitting it if need be.
