

1: Timer, a script and a textmeshpro. This was chosen as it made the most sense, and could keep counting up theoretically forever over the course of a game session. No other GUI were considered.

2: Pause Menu, script and two buttons, one to quit and one to resume. They were chosen after I realized that my Mac didn't have keyboard support within unity and I was running out of time to submit the assignment. As previously states, keybinding commands were considered, but discarded in favor of saving time.

3: Escape Button, connected the pause menu script to a button. This was when I discovered my lack of keyboard to unity connection. As such, it was implemented much sooner, but has allowed me to complete the assignment. As previously states, keybinding commands were considered, but ultimately discarded in favor of saving time.
